

Aerating Tips and Information

What does lawn aeration do?

Your lawn and the soil underneath it need to breathe. Aerating your lawn helps to control the thatch that makes it difficult for your lawn to breathe. It also reduces soil compaction, therefore allowing water and fertilizer to permeate into the root zone.

When should you aerate your lawn?

You should aerate in the spring as soon as the soil has thawed. However, for Northern lawns it is better to aerate in the fall. Grassy areas submitted to constant foot traffic require lawn aeration more frequently.

How does lawn aerating equipment work?

It pulls "cores" or plugs of soil out of the ground, letting air in. These plugs are 2-3 inches in depth, and should be pulled out of the lawn at about every 3 inches. It is important to water the lawn the day before aerating it with equipment. Check out our many aerating equipment online, in our showroom, or give us a call today!
